LINUX   FILE   SYSTEM   ANALYSIS

AIM:

To explore and apply live forensic file system analysis techniques on a compromised Linux environment. This includes investigating users, system logs, binaries, permissions, and digital artefacts to reconstruct the attack timeline and identify evidence of compromise.

PROCEDURE:

1. Isolate the compromised system and load clean binaries via USB for trusted analysis.

2. Modify the `PATH` and `LD_LIBRARY_PATH` to ensure only clean binaries are used.

3. Investigate suspicious uploads and artifacts under `/var/www/html/`.

4. Extract metadata, timestamps, and file integrity using tools like `stat`, `exiftool`, and checksum utilities.

5. Identify and investigate unusual user accounts, group IDs, and `sudoers` entries.

6. Review user history and SSH configurations for backdoors.

7. Examine SUID binaries, unverified executables, and detect rootkits.

TASK 1 – INTRODUCTION

- Introduced the importance of live file system forensic analysis in Linux environments.

- Emphasized the goal of identifying digital artefacts and compromise indicators.

- Clarified that remediation should not be done on live systems during initial analysis.

- Highlighted the focus on detecting unauthorized access, data tampering, and rootkits.

- Stressed the relevance of understanding logs, users, file structures, and permissions.

- Recommended restoring from backups after analysis, not reusing compromised systems.

After updating the `PATH` and `LD_LIBRARY_PATH` environment variables, run the command `check-env`. What is the flag that is returned in the output?

THM{5514ec4f1ce82f63867806d3cd95dbd8}   ✓ Correct Answer   ♡ Hint
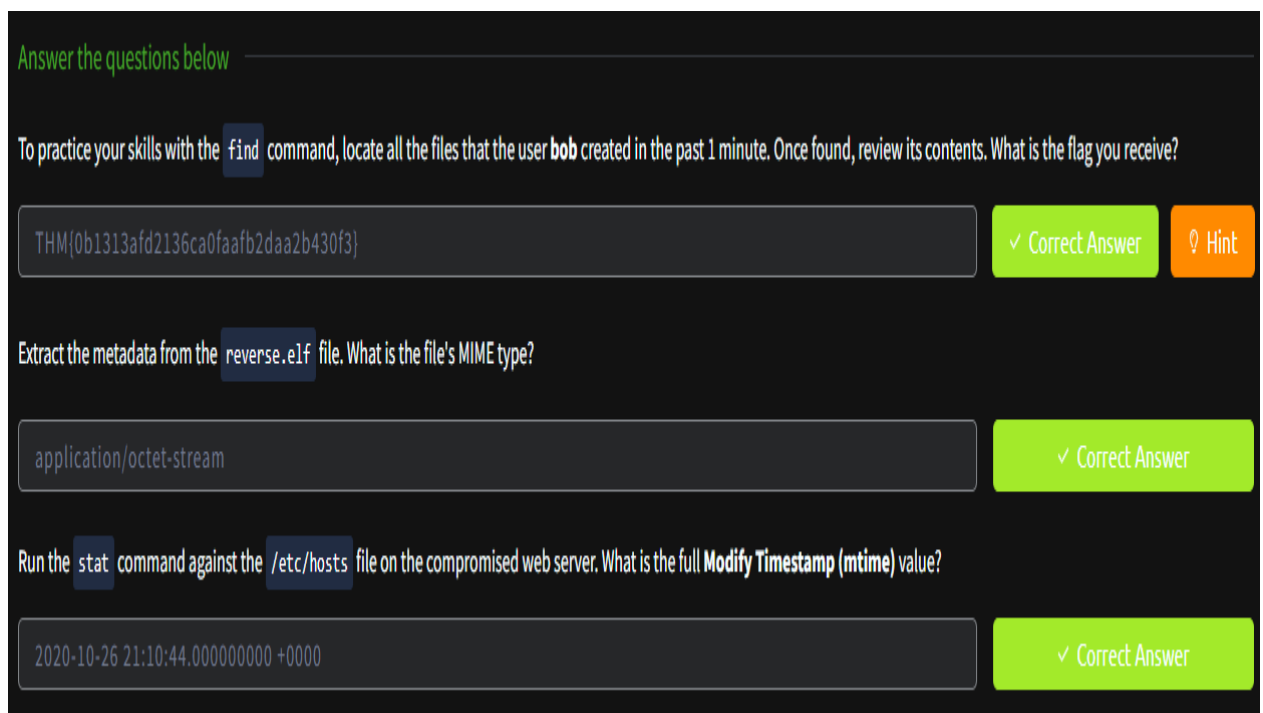

TASK 2 – INVESTIGATION SETUP

- Mounted a USB containing clean Debian-based binaries and libraries on the compromised system.

- Copied /bin, /sbin, /lib, and /lib64 folders to /mnt/usb for a trusted toolset.

- Updated PATH and LD_LIBRARY_PATH to prioritize clean binaries for forensic commands.

- Ensured the environment uses only verified binaries to avoid tampered results.

- Verified clean environment setup using the check-env script.

- Provided a secure and controlled setup for conducting further forensic analysis.

No answer needed	✓ Correct Answer
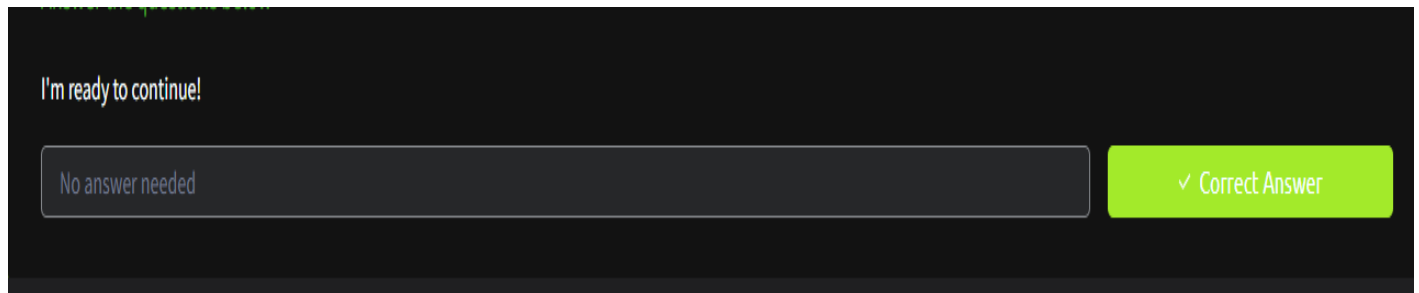

TASK 3 – FILES, PERMISSIONS & TIMESTAMPS

- Detected uploaded web shell `b2c8e1f5.phtml` via upload vulnerability.

- Found and analyzed reverse shell binary `reverse.elf`.

- Retrieved its metadata (MIME type), timestamps (`stat`), and computed hashes (MD5 & SHA256).

- Verified indicators via VirusTotal for malware classification.

- Practiced `find` command to identify files created by user `bob`.

Answer the questions below

To practice your skills with the `find` command, locate all the files that the user **bob** created in the past 1 minute. Once found, review its contents. What is the flag you receive?

THM{0b1313afd2136ca0faafb2daa2b430f3}	✓ Correct Answer	♀ Hint

Extract the metadata from the `reverse.elf` file. What is the file's MIME type?

application/octet-stream	✓ Correct Answer

Run the `stat` command against the `/etc/hosts` file on the compromised web server. What is the full **Modify Timestamp (mtime)** value?

2020-10-26 21:10:44.000000000 +0000	✓ Correct Answer

TASK 4 – USERS AND GROUPS

- Used `/etc/passwd`, `getent`, and `cat /etc/group` to identify suspicious users.

- Discovered backdoor UID 0 user.

- Identified group with GID 46.

- Inspected `/etc/sudoers` file to find binaries accessible to Jane.

- Observed that Jane could use `/sbin/ifconfig` with `sudo`.

Answer the questions below

Investigate the user accounts on the system. What is the name of the backdoor account that the attacker created?

| b4ckd00r3d | ✓ Correct Answer | ♀ Hint |

What is the name of the group with the group ID of **46**?

| plugdev | ✓ Correct Answer |

View the `/etc/sudoers` file on the compromised system. What is the full path of the binary that Jane can run as sudo?

| /usr/bin/pstree | ✓ Correct Answer |

TASK 5 – USER DIRECTORIES & SSH ACCESS

- Explored hidden files in home directories such as `.bash_history` and `.ssh/authorized_keys`.

- Found a backdoor SSH key in Jane's authorized_keys.

- Discovered flag in Jane's bash history.

- Located a hidden flag in Bob's home directory.

- Extracted modification timestamp for Jane's `.ssh/authorized_keys` using `stat`.

Answer the questions below

View Jane's `.bash_history` file. What flag do you see in the output?

THM{f38279ab9c6af1215815e5f7bbad891b}   ✓ Correct Answer

What is the hidden flag in Bob's home directory?

THM{6ed90e00e4fb7945bead8cd59e9fcd7f}   ✓ Correct Answer

Run the `stat` command on Jane's `authorized_keys` file. What is the full timestamp of the most recent modification?

2024-02-13 00:34:16.005897449 +0000   ✓ Correct Answer

TASK 6 – BINARIES & EXECUTABLES

- Used `find` and `debsums` to identify unauthorized root-owned binaries and config file modifications.

- Used `md5sum` and `strings` for integrity and behavior analysis.

- Identified altered system config files.

- Found attacker-created binary in `/var/tmp/bash` with suspicious MD5 hash.

Run the `debsums` utility on the compromised host to check only configuration files. Which file came back as altered?

/etc/sudoers

✓ Correct Answer

What is the `md5sum` of the binary that the attacker created to escalate privileges to root?

7063c3930affe123baecd3b340f1ad2c

✓ Correct Answer

TASK 7 – ROOTKIT DETECTION

- Ran `chkrootkit` and detected a suspicious `.sh` script.

- Used `rkhunter` to scan for deeper system integrity checks.

- Confirmed UID 0 account anomaly through rkhunter summary.

Answer the questions below

Run *chkrootkit* on the affected system. What is the full path of the `.sh` file that was detected?

/var/tmp/findme.sh

✓ Correct Answer

Run *rkhunter* on the affected system. What is the result of the `(UID 0) accounts` check?

Warning

✓ Correct Answer

RESULT:

Successfully identified indicators of compromise, backdoor accounts, and manipulated binaries. Demonstrated capability to use live forensics methodology in incident response and Linux system compromise investigations.
